According to our (Global Info Research) latest study, the global Surface Potentiometer market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

A surface potentiometer is a type of potentiometer that is designed to be mounted on a surface, such as a printed circuit board (PCB). It consists of a resistive track that can be adjusted by sliding a contact along its length. This contact is usually connected to a movable input or control, such as a knob or slider.

Surface potentiometers are commonly used in electronic devices and circuits to provide variable resistance or control. They are often used for applications such as volume control in audio equipment, brightness control in display devices, or variable input control in electronic instruments.

Compared to traditional potentiometers, surface potentiometers are more space-efficient and can be easily mounted and soldered onto a PCB. They are available in various sizes and specifications to meet different application requirements.
