## Abstracts

The global Surface Treatment Chemicals for Consumer Electronics Structural Components market size is expected to reach \$ 1965 million by 2032, rising at a market growth of 6.3% CAGR during the forecast period (2026-2032).

Surface Treatment Chemicals for Consumer Electronics Structural Components refer to formulation-based chemical systems applied to the surfaces of housings, middle frames, back covers, buttons, windows and decorative parts used in smartphones, tablets, laptops, wearables, smart home devices and other consumer electronics. The category mainly includes decorative coatings, transparent functional coatings, hardcoats, clearcoats, primers, conductive coatings, conductive inks, dielectric inks, NCVI-compatible coating systems and related pretreatment chemistries. These materials are typically formulated with resins, pigments and fillers, specialty additives, conductive fillers, solvent-borne or waterborne carriers and curing systems, and are used on substrates such as plastics, elastomers, glass, ceramics and metals. Their role is to enhance appearance, tactile quality, scratch resistance, chemical resistance, stain resistance, weatherability, optical clarity and wireless-signal compatibility. In commercial terms, this is not a single product, but a system-level materials family for decoration, protection and functional integration.

The global market for surface treatment chemicals used on consumer electronics structural components is evolving from a conventional appearance-coating segment into a core platform for product differentiation. As AI smartphones, AI PCs, AI glasses, wearables and smart home devices continue to expand, brand owners are demanding more than basic coloring and protection. Surface systems are now expected to deliver metallic visual effects, soft-touch feel, anti-fingerprint performance, sweat resistance,

chemical resistance, scratch durability and wireless-signal friendliness at the same time. PPG already frames the segment around decorative coatings, transparent functional coatings and conductive coatings and inks, while Momentive positions high-durability, high-clarity functional coatings directly for smartphones, tablets and laptops. AkzoNobel's UV NCVM platform for wireless-device middle frames and back panels further shows that the market is shifting toward integrated solutions that combine color, material, finishing process and performance.

At the same time, the sector faces rising barriers and more complex risks. Qualification cycles are long, cosmetic standards are strict and suppliers must balance yield, appearance consistency, regulatory compliance and rapid response during mass production. Environmental and sustainability requirements are also intensifying, pushing the market toward lower-VOC systems, lower-energy metallization routes and more reliable coating solutions for recycled plastics. AkzoNobel states that its UV NCVM system produces fewer hazardous waste by-products and consumes less energy than traditional electroplating, while the US EPA continues to regulate wastewater and pollutant control across relevant electronic manufacturing activities. Going forward, suppliers that can achieve stable mass production on recycled plastics, advanced engineering plastics and increasingly demanding cosmetic surfaces will be best positioned to secure premium programs from leading consumer electronics brands.
