According to our (Global Info Research) latest study, the global Surfacing Superheater market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The superheater is a part in the boiler that further heats the steam from the saturated temperature to the superheated temperature, and is one of the most important pressure-bearing and heat-exchanging parts of the boiler. The heating surface of the superheater is exposed to high temperature, high pressure and complex flue gas environment for a long time, so it is very vulnerable to corrosion and wear. The surfacing superheater uses the surfacing technology to deposit alloy materials with certain performance on the outer side of the superheater tube, so that the outer side of the superheater tube has special properties such as anti-corrosion, anti-wear, high temperature resistance, and high pressure resistance.

The increasing amount of garbage generated has gradually become a worldwide problem. According to data from the World Bank, global waste generation is expected to jump from 2.01 billion tons to 3.40 billion tons from 2016 to 2050. The increase in waste generation has provided a broad overseas market for the development of the waste incineration power generation industry and upstream industries. The market demand for cladding superheaters will also gradually increase in the future.
