Abstracts

According to our (Global Info Research) latest study, the global Surgery Information Management System market size was valued at US\$ 3723 million in 2025 and is forecast to a readjusted size of US\$ 6147 million by 2032 with a CAGR of 7.6% during review period.

A Surgery Information Management System (SMS) is specialized software that centralizes and streamlines all aspects of surgical care, from scheduling and resource allocation to patient records and billing, acting as a central hub for data, workflows, and communication in operating rooms (ORs) for improved efficiency, safety, and financial performance. It integrates various functions like perioperative EHRs, anesthesia management (AIMS), business intelligence, and revenue cycle management to support surgeons, nurses, and administrators.

The upstream of a surgery information management system mainly includes servers and storage hardware, network and cybersecurity equipment, databases and operating systems, basic software tools, standardized interfaces, and healthcare data security technologies. The upstream segment is largely based on general IT infrastructure and compliance support, which affects system stability, data protection, and long-term maintenance costs. The downstream segment represents the core value of the system and is primarily composed of hospitals and specialized medical institutions, especially large general hospitals, tertiary hospitals, regional medical centers, and high-volume ambulatory surgery centers. Downstream applications focus on surgical scheduling and resource allocation, preoperative evaluation and approval, intraoperative process documentation, coordination of anesthesia and nursing workflows, postoperative data tracking, and quality and performance management. These functions directly support

hospitals in improving operating room utilization, reducing surgical delays, strengthening risk control, and meeting regulatory and audit requirements. As management becomes more refined, downstream users increasingly emphasize system interoperability with HIS, EMR, anesthesia systems, and materials management platforms, as well as the ability to support multi-campus operations, specialty-focused workflows, and high-throughput surgical environments.

In terms of development trends, surgery information management systems are evolving toward digitalization, platform-based architectures, and intelligent functions. Cloud deployment, mobile access, data visualization, and data-driven decision support are becoming standard, with growing integration of AI-assisted scheduling, surgical quality assessment, and clinical pathway management. Key growth drivers include the continuous increase in surgical volumes, pressure on medical resources, rising demand for refined hospital operations, and ongoing policy support for healthcare informatization, quality control, and data traceability. Constraints include the complexity of legacy hospital IT environments, integration challenges, high initial investment costs, and the learning curve for clinical staff adapting to digital workflows. Increasing data security and compliance requirements also add to implementation and operational complexity. From a profitability perspective, revenue is mainly generated through software licensing, project implementation, and long-term maintenance services.
