Surgical solid - state lasers are a type of laser devices used in surgical procedures. They utilize solid - state gain media, such as crystals or glasses doped with rare - earth or transition - metal ions, to generate laser light. These lasers are designed to produce specific wavelengths of light that can be precisely absorbed by target tissues in the body. By carefully controlling the energy, pulse duration, and beam characteristics of the laser, surgeons can perform a variety of surgical tasks, including cutting, ablation, coagulation, and vaporization of tissues with high precision and minimal damage to surrounding healthy tissues.
