Swedish porphyria is a rare autosomal dominant metabolic disorder affecting the production of heme resulting from a deficiency of the porphobilinogen deaminase. It is the most common of the acute porphyrias.

Panhematin (hemin) is a medication used to treat acute porphyria, a rare genetic disorder that affects heme production. Its effectiveness in managing acute porphyria attacks and reducing symptoms has driven market growth. The rarity of the condition and limited treatment options contribute to its niche status. However, challenges include the need for careful monitoring and potential side effects. The market competition is relatively small, as Panhematin remains a specialized therapy.
