Abstracts

The global Swine Artificial Insemination market size is expected to reach \$ 3030.7 million by 2029, rising at a market growth of 6.4% CAGR during the forecast period (2023-2029).

Increasing consumption of pork meat, adoption of artificial insemination in swine, demand for sustainable food production, and initiatives by key market players are some of the leading factors contributing to the market growth. As per OECD estimates, global consumption of pork meat is projected to increase from 112.58 megatons in 2022 to 127.27 megatons in 2029. Amongst the several countries, China is a major producer as well as consumer of pork meat and is expected to remain dominant over the forecast period.

The demand in the swine artificial insemination market has been increasing over the years due to its numerous benefits such as the ability to improve genetics, reduce disease transmission, and increase productivity. Moreover, artificial insemination can be used to improve the overall productivity and profitability of pig farming. By using high-quality semen from genetically superior boars, pig farmers can produce piglets that have better growth rates, increased meat yield, and improved feed conversion ratios. This ultimately leads to higher profits for pig farmers.
