Abstracts

The global Switched Reluctance Motors market size is expected to reach \$ 650 million by 2032, rising at a market growth of 5.4% CAGR during the forecast period (2026-2032).

The switched reluctance motor (SRM) is a type of speed-regulating motor. It is a new type of speed-regulating motor developed after the DC motor and the brushless DC motor (BLDC). The switched reluctance motor works based on the principle that the magnetic flux is always closed along the path with the largest magnetic permeance. When the center lines of the stator and rotor teeth do not coincide and the magnetic permeance is not the largest, the magnetic field will generate magnetic pull, forming a magnetic resistance torque, causing the rotor to rotate to the position with the largest magnetic permeance. Its operation follows the 'minimum magnetic resistance principle', that is, the magnetic flux is always closed along the path with the smallest magnetic resistance.

Switched reluctance motors have been successfully applied to many fields such as electric vehicle drives, general industry, household appliances and textile machinery, showing a wide range of application prospects and huge development potential.

With the increasing popularity of energy-saving and environmental protection concepts, the energy efficiency of motors has attracted more and more attention. In the future, the high efficiency of switched reluctance motors will become an important direction of their development. By adopting new materials and processes, the efficiency and performance of motors will be continuously improved to meet market demand.

With the continuous advancement of technology, switched reluctance motors will be

increasingly used in multiple fields, such as automobiles, robots, aviation, etc. In the future, switched reluctance motors will not only be traditional drive devices, but will integrate multiple functions, such as induction, control, monitoring, etc. This will greatly improve the intelligence level and application scope of motors.

With the continuous development of miniaturization technology, switched reluctance motors will become increasingly miniaturized. In the future, switched reluctance motors will use smaller cores and coils, which will greatly optimize the size and weight of the motors. This will enable the application of switched reluctance motors in some special fields to be better developed.
