According to our (Global Info Research) latest study, the global Switching Mode Power Supply market size was valued at USD 27710 million in 2023 and is forecast to a readjusted size of USD 32270 million by 2030 with a CAGR of 2.2% during review period.

A switched-mode power supply (switching-mode power supply, switch-mode power supply, switched power supply, SMPS, or switcher) is an electronic power supply that incorporates a switching regulator to convert electrical power efficiently. Like other power supplies, an SMPS transfers power from a DC or AC source (often mains power) to DC loads, such as a personal computer, while converting voltage and current characteristics.

Unlike a linear power supply, the pass transistor of a switching-mode supply continually switches between low-dissipation, full-on and full-off states, and spends very little time in the high dissipation transitions, which minimizes wasted energy. Ideally, a switched-mode power supply dissipates no power. Voltage regulation is achieved by varying the ratio of on-to-off time. In contrast, a linear power supply regulates the output voltage by continually dissipating power in the pass transistor. This higher power conversion efficiency is an important advantage of a switched-mode power supply. Switched-mode power supplies July also be substantially smaller and lighter than a linear supply due to the smaller transformer size and weight.

Global Switching Mode Power Supply main players are DELTA, Lite-On Technology, Salcomp, Cosel, etc. Global top three manufacturers hold a share nearly 20%. Asia-Pacific is the largest market, with a share over 70%.
