Abstracts

According to our (Global Info Research) latest study, the global Synthetic Aerogel market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Aerogel is a typical nanoporous material, formed by the mutual aggregation of colloidal particles or polymers, and a highly dispersed three-dimensional porous solid material using gas as the dispersion medium. Aerogels are mostly translucent and extremely light. They are also called "solid smoke" or "frozen smoke". Their pore size ranges from 1 to 100nm, and their porosity ranges from 80% to 99.8%. Because its pore size is at the nanometer level, aerogels have a weak Tyndall effect, and colorless silica aerogels appear light blue. There are many types of aerogels, which can be divided into inorganic, organic, and inorganic-organic series according to the properties of the components; according to the number of oxides, they are divided into unit oxide aerogels, metal-oxide aerogels and multi-oxide aerogels. glue. The preparation of aerogels mainly includes the preparation and drying of wet gels. The preparation process of wet gels usually uses the sol-gel method; drying methods include supercritical drying, subcritical drying, normal pressure drying and freezing. Drying method. Aerogel has a wide range of applications. For example, due to its excellent thermal insulation properties, aerogel can be used to make thermal insulation clothing, thermal insulation blankets, heat-proof tiles, etc.; in the field of chemical and environmental protection, aerogel can be used for sewage treatment; In the field of new energy, aerogel can be used to store hydrogen; in the field of space science research, aerogel can capture high-speed particles in space; in the field of food industry, aerogel can be used for food packaging and storage; in the field of agriculture, aerogel can The gel absorbs and kills the insect's lipid layer, thereby protecting the food.
