Abstracts

According to our (Global Info Research) latest study, the global Synthetic Vinegar market size was valued at US\$ 3868 million in 2024 and is forecast to a readjusted size of USD 4752 million by 2031 with a CAGR of 3.0% during review period.

Synthetic vinegar is a type of vinegar produced through chemical synthesis, primarily composed of acetic acid and water. Unlike traditional naturally brewed vinegar, synthetic vinegar is not made through fermentation but by blending chemically synthesized acetic acid with water in specific proportions. This product lacks the complex esters, alcohols, and other flavor compounds found in naturally fermented vinegar, resulting in a more straightforward taste profile. Due to its lower production costs and shorter manufacturing cycles, synthetic vinegar is widely used in industrial and commercial applications, such as food processing, cleaning products, and agricultural use. While synthetic vinegar is approved for food use in many countries, its application is strictly regulated, often requiring clear labeling to indicate it as 'synthetic vinegar.'
