Systemic control agents are a class of pesticide active substances that can be absorbed by plant tissues and conducted in the body. They are commonly used in fungicides, insecticides and herbicides. Once absorbed by the plant, these agents can move up and down or laterally along the xylem or phloem in the plant body, thereby protecting the entire plant, especially for new leaves or parts that have not been sprayed with the agent. They also have a continuous control effect. Compared with traditional contact pesticides, systemic control agents have the advantages of long-lasting efficacy, high efficiency of use, and strong ability to control hidden pests and diseases.
