Systemic foliar fungicide is a type of fungicide that can be absorbed by plant tissues and conducted in the body after being applied to plant leaves, thereby fighting pathogenic fungi in the plant body. Unlike contact fungicides that only form a protective layer on the leaf surface, systemic foliar fungicides usually act on the physiological processes of fungi, such as interfering with their cell membrane synthesis or respiratory chain function, so they can also play a therapeutic role after infection by pathogens. This type of fungicide can be systemically transferred to various parts of the plant through the xylem or phloem, and has the advantages of broad spectrum, long duration of effect, and long interval between medications for the prevention and treatment of leaf spot diseases, rust diseases, powdery mildew, etc. It is widely used in crops such as wheat, rice, corn, grapes and fruit trees.
