Abstracts

Systemic scleroderma is a systemic autoimmune disease characterized by localized or diffuse skin thickening and fibrosis. The lesions were characterized by fibrous hyperplasia and onion like changes in blood vessels, which eventually led to skin sclerosis and vascular ischemia. This disease is characterized by localized or diffuse skin thickening and fibrosis. In addition to skin involvement, it can also affect visceral organs (such as heart, lung and digestive tract). As an autoimmune disease, it is often accompanied by autoantibodies such as antinuclear antibody, anti centromere antibody and anti ScL-70. The incidence rate of this disease is more than 4 times that of men, and children are relatively rare.
