Tactile paving bricks are a type of ground tile designed to provide guidance and prompts for the safe travel of blind individuals, falling into the category of barrier-free facilities. Through special tactile and color designs, they assist blind people in identifying information such as road directions, locations, and the positions of various facilities. Based on different functions, they are divided into two shapes: one is characterized by striped protrusions, which allow blind individuals to walk along the direction of the stripes by feeling with the soles of their feet, guiding them to move forward continuously on the path; the other features dotted protrusions, used to alert blind people to intersections, obstacles, hazardous areas, and so forth ahead. These are often square or circular in shape, instructing blind individuals to temporarily stop.
