Abstracts

Tamarind gum, also referred to as “tamarind seed polysaccharide” and “tamarind seed gum”, is obtained from the seed of the tamarind tree (*Tamarindus indica* L), which grows in subtropical and tropical climates. Tamarind gum is comprised mainly of a water soluble galactoxyloglucan polysaccharide that is obtained by extraction from tamarind seed. Galactoxyloglucan is composed of a linear chain of (1?4)-?-d-glucan that is partially substituted with side chains of (1?6)-?-d-xylopyranose and ?-d-galactopyranosyl linked with (1?2)-a-d-xylopyranose linked (1?6) to glucose residues. The ratio by weight of the three sugar constituents (glucose, xylose, and galactose) in tamarind gum is approximately 3:2:1 respectively. Tamarind gum is obtained from endosperm of seeds of the tamarind tree, which is a seed gum with potential industrial applications. Tamarind gum is having applications in paper, food, textile industry etc. Recent years it has been more used in pharmaceutical and cosmetic applications.
