The global Tangential Occlusion Clamp market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Tangential occlusion clamp is a surgical instrument used to temporarily occlude or block blood flow in vessels during surgical procedures. It typically features a curved, hinged design with serrated jaws that can be locked or clamped shut. The tangential occlusion clamp is carefully positioned on a blood vessel, allowing the surgeon to block or control blood flow while maintaining a clear surgical field. It is commonly used in vascular surgeries to manage bleeding, isolate specific sections of blood vessels, or create a controlled environment for repairs, anastomoses, or grafting procedures.
