The global Tapered Optical Amplifier market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A tapered optical amplifier is an optical device that amplifies an incoming optical signal. Its structure resembles a cone, with a tapering shape. When the optical signal passes through the tapered optical amplifier, the intensity of the light increases due to the reflection and refraction of the light in the cone. Such devices are commonly used in applications such as optical communications and optical sensors.
