Abstracts

The global Targeted Metabolomics market size is expected to reach \$ 253 million by 2032, rising at a market growth of 11.3% CAGR during the forecast period (2026-2032).

Targeted metabolomics is a study in which defined metabolites in a sample are identified and quantitatively analyzed. Quantitation and semi-quantitation of defined metabolites are undertaken through the use of internal standard compounds. Targeted metabolomics has an advantage of high specificity and accuracy. Thus, this method has been widely used to analyze and compare multiple targeted metabolites under different physiological states, and is a critical analytical method for discovery of new biomarker in metabolic diseases and study of early diagnosis of diseases.

Targeted metabolomics is a rapidly growing and highly commercialized sub-segment of the metabolomics market. Its strong growth is primarily due to its superior suitability for absolute quantification, batch-to-batch standardization, clinical translation, and biomarker validation compared to non-targeted metabolomics. Demand is mainly driven by drug development, clinical research, precision medicine, nutrition, and chronic disease management. The core technologies are LC-MS/MS, particularly triple quadrupole platforms, with business models focusing on standardized panels, customized panels, and outsourced testing services. In terms of competition, upstream instrument manufacturers such as SCIEX, Thermo Fisher, Agilent, Waters, and Bruker dominate, while biocrates is a representative player in standardized reagent kits/solutions. Service providers include Metabolon, Creative Proteomics, Novogene, BGI, and Metware. Overall, targeted metabolomics represents a sub-segment with high technological barriers, strong service attributes, and a clear focus on clinical and industrial applications.

This report studies the global Targeted Metabolomics demand, key companies, and key regions.
