According to our (Global Info Research) latest study, the global Targeted Metabolomics market size was valued at US\$ 120 million in 2025 and is forecast to a readjusted size of US\$ 253 million by 2032 with a CAGR of 11.3% during review period.

Targeted metabolomics is a study in which defined metabolites in a sample are identified and quantitatively analyzed. Quantitation and semi-quantitation of defined metabolites are undertaken through the use of internal standard compounds. Targeted metabolomics has an advantage of high specificity and accuracy. Thus, this method has been widely used to analyze and compare multiple targeted metabolites under different physiological states, and is a critical analytical method for discovery of new biomarker in metabolic diseases and study of early diagnosis of diseases.

Targeted metabolomics is a rapidly growing and highly commercialized sub-segment of the metabolomics market. Its strong growth is primarily due to its superior suitability for absolute quantification, batch-to-batch standardization, clinical translation, and biomarker validation compared to non-targeted metabolomics. Demand is mainly driven by drug development, clinical research, precision medicine, nutrition, and chronic disease management. The core technologies are LC-MS/MS, particularly triple quadrupole platforms, with business models focusing on standardized panels, customized panels, and outsourced testing services. In terms of competition, upstream instrument manufacturers such as SCIEX, Thermo Fisher, Agilent, Waters, and Bruker dominate, while biocrates is a representative player in standardized reagent kits/solutions. Service providers include Metabolon, Creative Proteomics, Novogene, BGI, and Metware. Overall, targeted metabolomics represents a sub-segment with high technological barriers, strong service attributes, and a clear focus on clinical and

industrial applications.
