According to our (Global Info Research) latest study, the global Targeted Protein Degradation Service market size was valued at US\$ 342 million in 2025 and is forecast to a readjusted size of US\$ 669 million by 2032 with a CAGR of 10.0% during review period.

Targeted protein degradation service involves the selective degradation of specific proteins within cells through specific means. This service utilizes technologies such as small molecule inhibitors, antibody-drug conjugates, and gene-editing tools to achieve precise removal of proteins. Targeted protein degradation services have wide applications in drug discovery, disease treatment, and biological research. By degrading pathogenic or abnormal proteins, normal cellular function can be restored, treating various diseases such as cancer and neurodegenerative disorders. This service provides new strategies and methods for drug discovery, promoting the development of precision medicine and personalized treatment.

From an industry chain perspective, targeted protein degradation sits within the advanced biopharmaceutical innovation ecosystem, with upstream activities centered on drug discovery inputs such as target identification platforms, structural biology, ligand screening technologies, E3 ligase libraries, chemical building blocks, and enabling tools provided by CROs, reagent suppliers, and computational biology firms. The development stage is driven by biotech and pharmaceutical companies leveraging medicinal chemistry, protein engineering, and translational research capabilities to design degrader molecules and advance them through preclinical and clinical pipelines. Downstream, the outputs are therapeutic candidates applied across oncology, neurodegenerative diseases, and other protein-driven disorders, ultimately reaching

hospitals and patients through established pharmaceutical commercialization channels. Demand is closely tied to the need for novel mechanisms to address previously ?undruggable? targets, positioning targeted protein degradation as a high-value, innovation-driven segment within the broader drug development landscape.

From a market perspective, targeted protein degradation represents a high-growth, innovation-driven segment of the biopharmaceutical industry, fueled by its ability to address previously undruggable targets and deliver differentiated therapeutic mechanisms. The field is led by PROTACs and molecular glues, which have advanced into clinical stages, while next-generation platforms such as lysosome- and autophagy-based degraders are expanding the addressable target space. Strong interest from major pharmaceutical companies?through partnerships, licensing, and acquisitions?continues to validate the technology and accelerate pipeline development. At the same time, the market remains early-stage and high-risk, with challenges in drug delivery, selectivity, safety, and clinical validation still to be resolved. Overall, the industry exhibits characteristics of a platform-driven biotech market with significant long-term upside, increasing capital inflow, and the potential to reshape drug discovery paradigms over the next decade.
