## Abstracts

According to our (Global Info Research) latest study, the global TCO Coating Service market size was valued at US\$ 1556 million in 2025 and is forecast to a readjusted size of US\$ 2186 million by 2032 with a CAGR of 5.0% during review period.

TCO coating services refer to the professional manufacturing service that uses thin-film processes such as physical vapor deposition (PVD), magnetron sputtering, and chemical vapor deposition (CVD) to prepare a transparent conductive oxide film with dual characteristics of 'high light transmittance + high conductivity' on the surface of glass, plastic, or flexible substrates. Common materials include ITO, FTO, and AZO. This type of coating allows for both high visible light transmittance and current conduction, making it a key functional thin-film layer for touch screens, solar cells, OLED displays, smart glass, and flexible electronic devices.

The future growth of TCO coating services is mainly driven by three trends: First, the rapid expansion of the photovoltaic industry, with TCO conductive layers being important electrode materials for crystalline silicon and thin-film batteries; second, the continuous rise in demand for ITO/AZO driven by upgrades in display technology; and third, the rapid popularization of building energy conservation and smart glass under the 'zero-carbon building' policy. Simultaneously, material systems are evolving from ITO to alternative materials such as AZO, FTO, and graphene to reduce dependence on indium resources and improve cost efficiency. Overall, TCO coating services are shifting from a 'display-driven market' to a structural growth phase driven by 'photovoltaics + building + flexible electronics'.
