Abstracts

According to our (Global Info Research) latest study, the global TCXO and VC-TCXO market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Temperature compensated crystal oscillators and voltage controlled temperature compensated crystal oscillators are electronic devices based on the crystal oscillator technology and are used to provide stable frequency signals. The temperature compensated crystal oscillator uses a temperature sensor and a temperature compensation circuit to offset changes in the crystal oscillator frequency at different temperatures. The voltage controlled temperature compensated crystal oscillator combines the characteristics of a voltage controlled oscillator and a temperature compensated crystal oscillator. It adjusts the frequency of the oscillator by changing the control voltage, and uses temperature compensation technology to offset frequency drift caused by temperature changes. By controlling the input voltage, precise control of the output frequency can be achieved and stability at different temperatures can be maintained.

Temperature compensated crystal oscillators and voltage controlled temperature compensated crystal oscillators play an important role in many applications, especially where high-precision time reference or frequency stability is required. They provide accurate and reliable clock signals to support a variety of timing, synchronization, and modem operations. At the same time, they can also be used in other applications requiring frequency stability.
