Abstracts

The global Tea Residue Dietary Fiber market size is expected to reach \$ 4.28 million by 2032, rising at a market growth of 16.8% CAGR during the forecast period (2026-2032).

In 2025, global sales volume of tea residue dietary fiber was approximately 120 metric tons, with an average selling price of about US\$8.8 per kilogram. Tea residue dietary fiber is a food-grade dietary fiber ingredient produced primarily from the solid residues generated during the manufacture of instant tea, tea beverages, tea polyphenols, or other water-soluble tea extracts. It is processed through dewatering, drying, milling, and sieving, with optional washing, purification, enzymatic treatment, fermentation, extrusion modification, or granulation, and is mainly supplied in powder and granular forms. The product is generally dominated by insoluble dietary fiber, while purification and modification processes can increase total dietary fiber content, soluble fiber proportion, water-holding capacity, swelling capacity, dispersibility, and processing stability, while reducing the coarse texture, bitterness, and color impact associated with untreated tea residue. This study focuses on tea residue-derived dietary fiber ingredients used in dietary supplements, meal replacement and nutrition powders, bakery products, cereal foods, and other high-fiber food products.

Growth in the tea residue dietary fiber market is primarily driven by the higher-value utilization of tea-processing by-products, food manufacturers' waste and carbon reduction initiatives, and rising consumer demand for high-fiber diets. Expanding production of instant tea, tea beverages, and tea extracts provides a stable and relatively low-cost supply of tea residues, while advances in drying, debittering, decolorization, ultrafine milling, enzymatic treatment, and fermentation are improving taste, color, purity, and processing performance. Increasing acceptance of natural and upcycled functional ingredients in meal replacements, dietary supplements, bakery

products, and cereal foods is also supporting the transition from internal by-product utilization to standardized commercial food ingredients. Near-term growth remains constrained by limited product standards, sensory challenges, and the small number of confirmed commercial producers.
