Tecar therapy, also known as Capacitive-Resistive Energy Transfer (CRET) therapy, is a type of physical therapy that uses high-frequency electromagnetic waves to stimulate tissue healing and reduce pain. The therapy involves the use of a device that emits electromagnetic waves, which are directed at the affected area of the body through handheld electrodes or pads placed directly on the skin. The electric current generated by the device is designed to penetrate deep into the tissues, where it can stimulate blood flow, improve circulation, and promote cell repair and regeneration. Tecar therapy is often used to treat various conditions, including chronic pain, sports injuries, joint problems, and muscle strains.
