The global Telecom Interface IC market size is expected to reach \$ 1445 million by 2032, rising at a market growth of 4.0% CAGR during the forecast period (2026-2032).

Telecom interface ICs (ICs) are integrated circuits used to enable signal transmission and protocol adaptation between different devices or networks in a communication system. They perform functions such as level conversion, signal driving and reception, encoding and decoding, and interface standard matching, and are widely used in wired communication, data transmission, and network equipment.

Upstream raw materials for telecom interface ICs include silicon wafers, epitaxial wafers, packaging materials, photoresists, etching gases and chemical reagents, and doping materials. The core midstream processes are IC design, wafer manufacturing, and packaging and testing. Downstream applications are mainly in communication equipment, industrial control, power systems, the Internet of Things (IoT), automotive electronics, and consumer electronics.

In 2025, global telecom interface IC sales reached 1.25 billion units, with a production capacity of approximately 1.51 billion units. The average selling price was \$0.85 per unit, and the average gross margin was 30%-40%.

This report studies the global Telecom Interface IC production, demand, key manufacturers, and key regions.
