According to our (Global Info Research) latest study, the global Telecom Optical Transceiver market size was valued at USD 4413.1 million in 2023 and is forecast to a readjusted size of USD 4726.7 million by 2030 with a CAGR of 1.0% during review period.

An optical transceiver is also called fiber optic transmitter and receiver. The role of the optical module is photoelectric conversion. The transmitter end takes in and converts the electrical signal into light, after the optical fiber transmission in the fiber cable plant; the receiver end again converts the light signal into electrical signal. Both the receiver and the transmitter ends have their own circuitry and can handle transmissions in both directions.

Fiber-optic communication is a method of transmitting information from one place to another by sending pulses of light through an optical fiber. The light forms an electromagnetic carrier wave that is modulated to carry information. First developed in the 1970s, fiber-optics has revolutionized the telecommunications industry and have played a major role in the advent of the Information Age. Because of its advantages over electrical transmission, optical fibers have largely replaced copper wire communications in core networks in the developed world. Optical fiber is used by many telecommunications companies to transmit telephone signals, Internet communication, and cable television signals. Researchers at Bell Labs have reached internet speeds of over 100 Petabit *kilometer per second using fiber-optic communication.

Global 5 largest manufacturers of Telecom Optical Transceiver are Coherent Corp., Zhongji InnoLight Co, Ltd., Cisco Systems Inc., Huawei Technologies Co., Ltd. and
