A temperature calibrator is a special instrument used to measure and calibrate temperature. It verifies the accuracy and reliability of a temperature sensor by comparing the temperature difference between a standard element with a known temperature and the temperature element to be calibrated. Temperature calibrators are widely used in equipment and environments that require precise temperature control, such as thermometers, ovens, refrigerators, air conditioners, and various industrial production lines. Its basic principle is based on the law of heat conduction, and the temperature sensor is calibrated by precisely controlling the temperature standard element.

In terms of regions, North America is expected to remain the largest market during the forecast period.
