Abstracts

The global Temperature Compensated Pressure Transmitters market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Temperature compensated pressure transmitter is a pressure measurement and transmission device with temperature compensation function. It can automatically adjust the output signal to compensate the influence of temperature on pressure measurement to provide more accurate and stable pressure measurement results. Temperature changes can affect the precision and accuracy of pressure transmitters. Due to the sensitivity of pressure sensors and circuit components to temperature, temperature changes may cause deviations in the signal value output by the pressure transmitter. The temperature compensated pressure transmitter can measure the ambient temperature in real time through the internal temperature sensor and compensation circuit, and correct the output signal according to the preset temperature compensation algorithm to eliminate the influence of temperature changes on pressure measurement. Temperature-compensated pressure transmitters are widely used in fields that require high-precision pressure measurement, especially in environments with large temperature changes or frequent temperature fluctuations. For example, in industrial process control, temperature-compensated pressure transmitters can provide more accurate pressure monitoring to ensure system stability and reliability. In addition, it is also commonly used in liquid level measurement, gas flow control, liquid pressure monitoring and other applications to ensure accurate pressure data under different temperature conditions.
