## Abstracts

The global Tempered Photovoltaic Glass market size is expected to reach \$ 19340 million by 2029, rising at a market growth of 15.5% CAGR during the forecast period (2023-2029).

Global key players of Tempered Photovoltaic Glass include Xinyi Solar and Flat Glass Group, etc. The top two players hold a share over 60%. China is the largest market, has a share about 80%. In terms of product type, 3.2mm is the largest segment, occupied for a share of about 67%, and in terms of application, Single Glass Module has a share about 65 percent.

Tempered photovoltaic glass is a specialized type of glass used in the construction of solar panels or photovoltaic modules, preventing environmental factors like vapors, water, and dirt from damaging the photovoltaic cells. Tempered solar panel glass also provides high strength, excellent transmissivity, and low reflection.

The key characteristic of tempered PV glass is its enhanced strength and resistance to mechanical stresses and thermal variations. This is achieved through a tempering process where the glass is heated to high temperatures and then rapidly cooled. This rapid cooling creates a surface compression on the glass, making it more robust and less prone to breakage. Tempered PV glass is also designed to have specific optical properties that allow it to efficiently transmit sunlight while minimizing reflection and maximizing light absorption by the solar cells within the panel. Anti-reflective coatings are often applied to improve light transmission and enhance the overall efficiency of the solar panel.

In summary, tempered photovoltaic glass is a specialized type of glass engineered to

withstand the rigors of outdoor exposure, improve the efficiency of solar panels, and contribute to the reliable and long-term performance of photovoltaic systems used to convert sunlight into electricity.
