## Abstracts

According to our (Global Info Research) latest study, the global Temporary Bonding and Debonding Systems market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The Asia Pacific region was expected to experience the fastest growth in the temporary bonding and debonding systems market, primarily due to the increasing demand for advanced packaging technologies in countries such as China, Japan, South Korea, and Taiwan. The growth of the semiconductor industry in the region and the increasing adoption of IoT and AI technologies were the major factors driving the market.

Temporary bonding and debonding systems are technologies used in the semiconductor manufacturing process to temporarily bond a thinned wafer onto a rigid carrier substrate for further processing, and then to debond it after the processing is complete. Temporary bonding is necessary for advanced packaging technologies, such as 3D ICs (Integrated Circuits), wafer-level packaging, and system-in-package, where thinned wafers need to be transferred to different processing tools without damaging them. Temporary bonding systems use adhesives or other materials to bond the thinned wafer to a carrier substrate, which allows for handling, processing, and testing of the wafer. Debonding systems are used to remove the thinned wafer from the carrier substrate without damaging it or its features. The debonding process can use mechanical, thermal, or chemical methods depending on the materials and adhesives used in the temporary bonding process.
