## Abstracts

The global Temporary Cardiac Stimulation Lead market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

The temporary cardiac stimulation lead has several advantages, including its ability to provide immediate pacing support to patients with bradycardia or heart block, its easy insertion and removal compared to permanent pacemakers, and its cost-effective use in the hospital setting. However, it also has disadvantages such as the risk of infection at the insertion site, the need for continuous monitoring to ensure proper lead positioning and function, and the limited duration of use due to the temporary nature of the lead. Additionally, there is a potential for lead displacement or malfunction, which can require urgent intervention.

A temporary cardiac stimulation lead is a thin, flexible wire that is temporarily inserted into the heart to deliver electrical impulses to regulate the heart's rhythm. This type of lead is typically used in emergency situations or during temporary procedures, such as during surgery or while waiting for a permanent pacemaker to be implanted. Temporary cardiac stimulation leads are designed to be easily inserted and removed, and are not meant for long-term use.
