Abstracts

According to our (Global Info Research) latest study, the global Temporary Lacrimal Plugs market size was valued at US\$ 89.2 million in 2024 and is forecast to a readjusted size of USD 138 million by 2031 with a CAGR of 6.3% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Temporary Lacrimal Plugs are small, biocompatible, and biodegradable medical devices designed for temporary insertion into the puncta (tear duct openings) of the eye. Their primary purpose is to block tear drainage through the nasolacrimal system, thereby increasing tear film retention on the ocular surface to relieve symptoms of dry eye syndrome. These plugs dissolve naturally over time and do not require surgical removal.

In the global ophthalmic treatment landscape, Temporary Lacrimal Plugs have emerged as an innovative, minimally invasive solution for patients suffering from dry eye disease. Their unique biodegradable properties and high patient compliance are driving sustained market demand worldwide, with North America standing out as the leading consumer region.

Dry eye disease has become a significant health concern globally, affecting individuals' quality of life. Factors such as lifestyle changes, environmental influences, and an aging population have contributed to the rising incidence of this condition. Traditional treatments often require patients to use artificial tears or rely on medications long-term. In contrast, Temporary Lacrimal Plugs offer a more convenient and comfortable

alternative.

The primary advantage of Temporary Lacrimal Plugs lies in their biodegradability. Unlike permanent plugs, these devices gradually dissolve within the eye, eliminating the need for surgical removal and significantly reducing patient treatment burden. Additionally, their minimally invasive nature ensures that patients experience less discomfort during treatment, enhancing the overall therapeutic experience.

North America has emerged as the largest consumer market for Temporary Lacrimal Plugs globally. According to recent market research reports, North America accounted for approximately 46% of the global market share in 2024. This dominance can be attributed to the region's highly developed healthcare system, advanced ophthalmic technologies, and a strong emphasis on eye health. The United States, in particular, has a high prevalence of dry eye disease, and patients are more receptive to new treatment methods, providing a favorable environment for the adoption of Temporary Lacrimal Plugs.

In terms of application, clinics have become the primary market for Temporary Lacrimal Plugs. In 2024, clinics accounted for about 63% of the global market. This trend reflects patients' demand for convenient and prompt treatment options. Clinics typically offer flexible appointment schedules and more affordable medical fees, making them an attractive choice for patients seeking treatment. Moreover, clinic-based ophthalmologists have accumulated extensive experience in diagnosing and treating dry eye disease, providing patients with professional medical services.

Although hospitals hold a certain share in the overall market, their application of Temporary Lacrimal Plugs is relatively limited. Hospitals often handle more complex ophthalmic conditions, and treatment processes can be more cumbersome. Patients may prefer long-term effective treatment options, leading them to opt for permanent solutions. Therefore, hospitals play a more supportive role in the application of Temporary Lacrimal Plugs.

Looking ahead, as the number of dry eye disease patients increases globally and patients' expectations for treatment methods rise, the market prospects for Temporary Lacrimal Plugs are promising. Particularly in North America, with continuous advancements in medical technology and diverse patient needs, Temporary Lacrimal Plugs are poised to play a more significant role in ophthalmic treatment.

In conclusion, Temporary Lacrimal Plugs are gradually transforming the treatment

landscape for dry eye disease with their unique advantages. Their widespread application in clinics and dominant position in the North American market indicate that this emerging treatment method will gain broader recognition and adoption worldwide. For patients, this means more treatment options and improved quality of life; for healthcare institutions, it presents an opportunity to enhance service quality and meet patient needs.
