According to our (Global Info Research) latest study, the global Tensioner Bearings market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The tensioner is located at the front of the internal combustion engine. A belt-driven outer ring mechanism, including timing belts, is essential in this unit. The tensioner provides tension to the belt that drives the camshaft, alternator, air compressor, power steering pump, and water pump from the crankshaft. The Tensioner Bearing is placed on the slack side. The Tensioner Bearing consists of a base, tensioner arm, spring and pulley. It provides pressure to the timing belt that drives the other pulleys, while relieving stress on the belt. The belt needs to run at constant tension to ensure that the alternator always has enough power to move the pulleys that drive all of these individual components.
