Abstracts

The global Tensioner Bearings market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The tensioner is located at the front of the internal combustion engine. A belt-driven outer ring mechanism, including timing belts, is essential in this unit. The tensioner provides tension to the belt that drives the camshaft, alternator, air compressor, power steering pump, and water pump from the crankshaft. The Tensioner Bearing is placed on the slack side. The Tensioner Bearing consists of a base, tensioner arm, spring and pulley. It provides pressure to the timing belt that drives the other pulleys, while relieving stress on the belt. The belt needs to run at constant tension to ensure that the alternator always has enough power to move the pulleys that drive all of these individual components.

This report studies the global Tensioner Bearings production, demand, key manufacturers, and key regions.
