According to our (Global Info Research) latest study, the global Terahertz Photoconductive Antennas market size was valued at US\$ 370 million in 2025 and is forecast to a readjusted size of US\$ 720 million by 2032 with a CAGR of 9.8% during review period.

Terahertz Photoconductive Antennas (THz PCA) are key devices used for generating and detecting terahertz radiation (0.1–10 THz). Their operation is based on ultrafast laser excitation of semiconductor materials (such as low-temperature-grown GaAs or InGaAs), which produces transient photocarriers under an applied bias electric field, resulting in broadband terahertz electromagnetic emission. In detection mode, the incident terahertz field modulates the photocurrent in the semiconductor, enabling coherent signal measurement. THz photoconductive antennas are widely used in terahertz time-domain spectroscopy (THz-TDS), non-destructive testing, security imaging, and research in high-speed wireless communications, and represent one of the most mature broadband terahertz generation and detection technologies in laboratory-scale systems. In 2025, global Terahertz Photoconductive Antennas production reached approximately 120 K units, average price 3000 USD/unit, gross margin 30%.
