The global Terminal Security Gateway market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The terminal security gateway is a network security device used to protect terminal devices in an enterprise network from threats such as malware, network attacks, and data leakage. It usually serves as the entry point of the enterprise network, monitors and controls the network traffic of end devices, and provides various security functions and services. The main functions of the terminal security gateway include: anti-virus and malware: the terminal security gateway can monitor the files and network traffic on the terminal device in real time, detect and prevent the spread of viruses, malware and malicious links. Firewall and intrusion detection: The terminal security gateway can set network access control policies to prevent unauthorized access and intrusion, and detect and prevent network attacks, such as DDoS attacks, SQL injection, etc. Data leakage prevention: The terminal security gateway can monitor and prevent sensitive data leakage, including file transfer, clipboard operation, printing, etc. Network access control: The terminal security gateway can restrict the terminal device's access to specific websites, applications and services according to policies, so as to protect the enterprise network from threats of malicious websites and unauthorized applications. Behavior analysis and threat intelligence: The terminal security gateway can analyze the behavior of terminal devices and compare it with the threat intelligence database to identify and block potential threats in a timely manner. The terminal security gateway provides comprehensive terminal security protection through centralized management and control of terminal device security, helping enterprises protect sensitive data, prevent network attacks, and ensure network stability and reliability.
