Abstracts

The global Test & Burn-in Socket market size is expected to reach \$ 2066.3 million by 2029, rising at a market growth of 7.2% CAGR during the forecast period (2023-2029).

Global key players of test & burn-in socket include Yamaichi Electronics, Cohu, Enplas, etc. The top three players hold a share about 33%. Asia-Pacific is the largest market, has a share about 62%, followed by North America and Europe.

There are two important tests in semiconductor manufacturing. One is the wafer test during the wafer process, in which electrical characteristics of chips are tested before dicing a wafer into many pieces of semiconductor (called dies or chips). The other is the final test during the assembly and testing process, which is conducted after packaging the diced chips. An IC socket is used in the final test. It plays the crucial role of connecting the device and the tester, just as a probe card does in the wafer test (see the figure below). Depending on the purpose of the test, IC sockets are categorized into two groups: burn-in sockets for testing reliability, including durability, and test sockets for measuring electrical characteristics. Although these two types are both generally referred to as IC sockets, the required performance varies depending on the difference in use.
