## Abstracts

According to our (Global Info Research) latest study, the global Tetramethylguanidine Acetate market size was valued at US\$ 0.84 million in 2025 and is forecast to a readjusted size of US\$ 1.49 million by 2032 with a CAGR of 8.3% during review period.

Tetramethylguanidinium Acetate is a guanidinium carboxylate-type ionic liquid/organic base salt formed from tetramethylguanidine and acetic acid. Currently, it is a niche, high-value functional chemical, produced in small batches with high validation costs, and suppliers are mainly focused on reagent or custom synthesis. The estimated overall gross margin is 58%.

The market for tetramethylguanidinium acetate is very small. Global sales are estimated at approximately USD 820,000 in 2025 and USD 900,000 in 2026. The primary reason is that the product has not yet developed clear large-scale industrial consumption scenarios. Demand mainly comes from universities, research institutions, corporate R&D departments, and a limited number of pilot tests. Commercially available forms on official websites are mostly small packages or upon inquiry, indicating that transactions resemble functional reagents or custom ionic liquids rather than bulk commodity chemicals.

Growth is driven by continued research on ionic liquids in cellulose, biomass materials, membrane materials, and green solvent systems, as well as studies on guanidinium-based ionic liquids for CO<sub>2</sub> absorption.

Over the next six years, the product is expected to experience “low-base, moderate-scale” growth rather than rapid industrialization. This is because acetate-based systems

are sensitive to moisture, viscosity, recovery, and batch stability. Scaling up production downstream typically involves comparisons with other ionic liquids, deep eutectic solvents, or traditional solvent systems.
