Abstracts

The global Textile Materials for Inkjet Printing market size is expected to reach \$ 11548 million by 2032, rising at a market growth of 7.1% CAGR during the forecast period (2026-2032).

Textile materials for inkjet printing refer to various fabrics, materials, and related substrates suitable for digital inkjet printing processes. These typically include cotton, polyester, nylon, silk, wool, blended fabrics, and functional textile materials. These materials need to possess good ink absorption, uniform coloring, color reproduction, dimensional stability, and post-processing adaptability. They must be able to withstand reactive dyes, disperse dyes, acid dyes, or pigment inks during inkjet printing and achieve pattern fixation through processes such as steaming, washing, and heat curing. They are widely used in apparel fabrics, home textiles, decorative fabrics, advertising fabrics, personalized custom textiles, and industrial textiles.

The upstream of the textile materials for inkjet printing mainly includes fiber raw materials such as cotton, polyester filament, nylon, viscose, wool, and silk, as well as spinning, weaving, dyeing and finishing auxiliaries, inkjet inks, pretreatment solutions, and coating materials. The midstream involves fabric processing, pretreatment, coating, inkjet printing, color fixing, washing, finishing, and quality inspection for digital inkjet printing. Core companies typically include textile fabric factories, dyeing and printing plants, digital printing processing plants, and functional fabric suppliers. Downstream applications include apparel, home textiles, home decoration, advertising displays, sports and outdoor products, personalized customization, and industrial textiles. Overall, the gross profit margin for ordinary inkjet printed fabric processing is generally around 15%–25%. Companies with independent pattern design, rapid response to small-batch orders, functional finishing, or high-end digital printing capabilities can achieve gross

profit margins of 25%–40%, while the gross profit margin for simple fabric supply or low-end OEM processing is usually lower, around 8%–15%.

In 2025, the average price of textile materials for inkjet printing will be US\$9,150 per ton, with sales volume of 756.3 k tons and total production capacity of 1 million tons.

Overall, textile materials for inkjet printing will benefit from the trends of digitalization in textile printing and dyeing, small-batch rapid response, personalized customization, and green and environmentally friendly production, and market demand still has room for growth. As downstream applications in apparel, home textiles, sports and outdoor, e-commerce customization, and industrial textiles expand, the industry's development focus will shift from ordinary printable base fabrics to high ink absorption, high color fastness, low energy consumption color fixing, low-pollution finishing, and functional composite fabrics. The core of future competition will no longer be the price of a single fabric, but rather the comprehensive synergistic capabilities of 'fiber materials, pretreatment formulations, ink compatibility, printing processes, and finishing performance.' High-end pretreated fabrics, functional coating materials, and environmentally friendly inkjet printing textile materials will become the main growth drivers.
