Abstracts

The global Textile Oxygen Bleaching Stabilizer market size is expected to reach \$ 292 million by 2032, rising at a market growth of 3.3% CAGR during the forecast period (2026-2032).

Textile oxygen bleaching stabilizers are additives used in hydrogen peroxide bleaching processes. They precisely control the decomposition rate of hydrogen peroxide by chelating heavy metal ions such as iron and copper and adjusting the pH value. They effectively prevent fiber damage and holes caused by rapid hydrogen peroxide decomposition, and while improving the whiteness and feel of cotton, linen, and other fabrics, they also solve the problem of silica scale formation associated with traditional sodium silicate stabilizers. They are suitable for high-temperature bleaching and cold-pad-batch processes.

The upstream core components include basic inorganic chemicals (such as sodium silicate, i.e., water glass) and fine organic chemicals, such as organic phosphonates like HEDP and DTPMPA, and synthetic polymers such as polyacrylic acid and maleic anhydride copolymers.

In 2025, global sales are projected to be nearly 200,000 tons, with an average market price of approximately US\$1,130 per ton. The industry's gross profit margin is in the range of 20%–30%.

This report studies the global Textile Oxygen Bleaching Stabilizer production, demand, key manufacturers, and key regions.
