The global Textured Breast Implant market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Textured breast implant is a medical device used in breast augmentation or reconstruction surgeries. It refers to silicone or saline-filled implant with a textured surface. The texturing introduces a roughened or contoured surface to the implant, which helps to minimize the risk of implant rotation, improve tissue adherence, and reduce the occurrence of capsular contracture (tightening of scar tissue around the implant). Textured breast implants are available in various shapes, sizes, and profiles, allowing surgeons to choose the most suitable implant for each individual patient.

This report studies the global Textured Breast Implant production, demand, key manufacturers, and key regions.
