Abstracts

The global TFT Photomasks market size is expected to reach $ 1525 million by 2032, rising at a market growth of 4.4% CAGR during the forecast period (2026-2032).

A TFT photomask is a high-precision pattern master used for photolithography exposure in flat panel display panels. This product typically uses a highly flat synthetic quartz or glass substrate as a transparent substrate, on which a light-shielding film such as chromium is deposited, forming a precise light-transmitting and light-shielding pattern according to the panel design data. During exposure, the photomask transfers the circuitry or functional layer pattern it carries onto the photoresist on the display glass substrate, thus forming the pattern required for subsequent deposition, etching, and processing.

TFT photomasks are mainly used in the TFT-Array process of TFT-LCDs and color filter processes. They can also be used in the manufacturing of LTPS-LCDs, AMOLEDs, LTPO-OLEDs, IGZO-OLEDs, and some Mini-LED and Micro-LED backplanes. Its manufacturing typically includes processes such as photoresist coating, laser or electron beam pattern writing, development, chromium film etching, resist removal, cleaning, inspection, and defect repair.
