The global Therapeutic Recombinant Protein market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Therapeutic recombinant proteins are proteins that are produced by recombinant DNA technology and are used as drugs to treat various medical conditions. Recombinant DNA technology involves the use of genetically engineered microorganisms or cells to produce large quantities of a specific protein that has therapeutic potential. Therapeutic recombinant proteins are used to treat a wide range of medical conditions, including cancer, autoimmune diseases, genetic disorders, and infectious diseases. These proteins are designed to mimic the natural proteins in the body that regulate various biological processes. They are often administered by injection, and their effectiveness depends on the specific protein and the medical condition being treated.

This report studies the global Therapeutic Recombinant Protein demand, key companies, and key regions.
