According to our (Global Info Research) latest study, the global Thermal Conductor Paste market size was valued at USD 179 million in 2023 and is forecast to a readjusted size of USD 249.9 million by 2030 with a CAGR of 4.9% during review period.

Thermal conductor paste, also known as thermal grease, thermal compound, or thermal paste, is a type of material used to improve the thermal conductivity and heat transfer between two surfaces. It is commonly used in electronics, computer hardware, and other applications where efficient heat dissipation is crucial to prevent overheating and ensure optimal performance. The primary purpose of thermal conductor paste is to fill in microscopic air gaps and imperfections between two surfaces, such as a microprocessor (CPU) and a heat sink or a graphics processing unit (GPU) and a cooling solution. These small gaps can create thermal resistance, inhibiting the efficient transfer of heat from one component to another. Thermal conductor paste typically consists of a mixture of thermally conductive particles suspended in a carrier fluid. The particles are often made of materials like metal oxides, ceramics, or carbon-based materials. The carrier fluid is usually a silicone or non-silicone-based compound that helps the paste flow and spread evenly over the surfaces.

In the global market, Thermal Conductor Paste core manufacturers are mainly Henkel, Shin-Etsu Chemical, Parker Hannifin, ect. The top five players in this industry account for about 33% of the market share. North America, Europe, and Asia-Pacific are the major manufacturing regions for this product, with Asia-Pacific accounting for more than 60% of the global market share. The products can be classified into silicon-based and non-silicon-based according to the product structure and are widely used in electronics
