According to our (Global Info Research) latest study, the global Thermal Drying Dewatering Equipment market size was valued at USD 570.1 million in 2023 and is forecast to a readjusted size of USD 651.1 million by 2030 with a CAGR of 1.9% during review period.

Thermal drying technology is based on removal of water from dewatered solids which accomplishes both volume and weight reduction. The added benefit of thermal drying is that it typically results in a product with significant nutrient value. Typically, dewatered solids (at approximately 18% to 35% dry solids content) are delivered to a thermal drying system, where most of the water is removed via evaporation resulting in a product containing approximately 90% solids. In the thermal drying system, the temperature of the wet solids mass is raised so that the water is driven off as a vapor. By removing most of the water from the solids, thermal drying results in a significant reduction in both volume and mass.
