According to our (Global Info Research) latest study, the global Thermal Links market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

A thermal links or thermal fuse is an emergency device used to prevent electrical appliances from overheating. Like an electrical fuse, a thermal fuse completely burn outs when the machine it is attached to gets beyond its safety level. Unlike an electrical fuse, a thermal fuse is melted by excessive heat instead of shorted out by excessive current. A thermal fuse uses a fusible link--two pieces of metal which are attached together by a substance designed to melt at a particular temperature. Under normal circumstances, current runs through between the two plates, running the appliance. When it gets too hot, however, the fusible alloy--the substance which holds the pieces together--melts, and they spring apart, turning off the current.

For industry structure analysis, the thermal links industry is concentrate. Regionally, China is the biggest production area of thermal links, also the leader in the whole thermal links industry. Geographically, China was the largest consumption market in the world, followed by Europe. For price trend analysis, a key variable in the performance of thermal links producers is raw material costs, specifically the speed at which any increase can be passed through to customers.
