According to our (Global Info Research) latest study, the global Thermal Paste for Electrical Components market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

Thermal paste is a material used to transfer heat in electrical components. This material can be used in a variety of electrical and electronic manufacturing, and can play the role of heat conduction, moisture resistance, dust resistance, and shock resistance. Thermal paste needs to be used in the gap between the CPU and the heat sink to prevent the CPU temperature from being too high, which can extend the service life of the appliance.

The global chemical industry is part of the global economic development, and the cyclical economic development envelopes the global chemical industry. In recent years, global economic growth has slowed down, and the growth rate of the chemical industry has also gradually slowed down. The development of emerging economies such as China and India has continued to promote the global chemical industry to maintain a certain development trend in the past few years. In the future, these economies will continue to drive the chemical industry market forward with their large population base and strong domestic demand growth. In addition to the influence of the geopolitical characteristics of the Middle East, the shale gas industry in the United States among developed countries has become the biggest variable in recent years, driving the strong development of the U.S. chemical industry.
