Abstracts

The Thermal Resistance Tester is an advanced instrument for testing the thermal characteristics of semiconductor device packages, providing data on the thermal characteristics of all types of packages in a matter of minutes. The device provides a non-destructive method of thermal testing by varying the power input to the electronic device and testing the device's thermally relevant parameters to test the transient temperature change curve of the electronic device; numerically processing the temperature change curve to extract a structure function; and automatically analysing thermal property parameters such as thermal resistance and thermal capacity from the structure function.

This report studies the global Thermal Resistance Tester production, demand, key manufacturers, and key regions.
