Abstracts

Thermal spraying metal powder is a surface coating technology. The metal powder is heated to a high temperature through spraying equipment and then sprayed onto the surface of the object to be coated, where it melts and bonds with the surface of the object to form a metal coating. This coating technology is mainly used for anti-corrosion, wear resistance, high temperature resistance, etc. on the surface of metal substrates to improve the performance and service life of metal materials. The main component of thermal spray metal powder is metal powder. Commonly used metals include aluminum, zinc, copper, nickel, steel, etc. These metal powders will melt quickly after being heated and sprayed onto the surface of the object to be coated through an air flow or nozzle to form a uniform metal coating. This coating has good adhesion, wear resistance, corrosion resistance and thermal conductivity, and can effectively protect the surface of the coated object and extend its service life. Thermal spray metal powder is widely used in aerospace, automotive industry, marine engineering, building structures, power equipment and other fields. For example, it is used in coatings for aero-engine turbine blades, anti-corrosion coatings for automobile parts, and anti-corrosion coatings for offshore platforms. This coating technology has the advantages of low cost, simple process, uniform coating, and controllable coating thickness, so it is widely used.
